[1] The initial shelter surveys cover selected areas of high population density in the largest city of each critical target area, in all the critical target area cities of 100,000 or more population, and in eleven critical target area cities of less than 100,000 population. This table shows the progress and results of the survey in those cities for which data are available.

[2] Adequate shelter is defined as that which would be effective at approximately 1/2 mile or farther from ground zero of a 1,000 Hiroshima-type bomb and approximately [illegible] mile or farther from ground zero of a [illegible] bomb.
