FOLDERA Z

Brig. Cen. Thomas E. Lacy, USAF Commander Field Command Defense Buclear Agency Kirtland AFE, New Nextco 87115

Dear General Lacy:

As requested, a short description of ERDA planned radiological monitoring of nuclear test impacted Pacific atolls is provided. ERDA followup activities related to nuclear tests conducted in the Facific and resettlement of the residents of Bikini and Reswetak Atolls has been directed toward:

- 1. Assessments of environmental radiation and radioactivity levels on islands and atolls that received closs-in fallout from U.S. nuclear waspons tests in the Pasific.
- 2. Development of estimates of projected doses and associated risks for those who inhabit islands affected by fallout.
- 3. Development of recommendations for cleanup, rebabilitation, and use of test etolls in second with NEFA and Federal radiation protection requirements.
- 4. Support of DOD and DOI cleasup and rehabilitation field operations at test-accils.
- 5. long-term radiological monitoring followup of the environment and people of the test and near-test islands in the Northern Harabalis.

After cleanup and rehabilitation, follows monitoring of Bikini Atoll and the people living in that atoll was begun. This nonzists of one or more visits to the atoll each year by an ERCA survey team. Radiation monitoring and sample collection activities are planned and implemented that will provide basic data for agazasing the total radiation exposures of island residents considering both external and internal emitters. Whole body counting is performed and samples of urine collected. Samples of marine and terrestrial biota, particularly those in the human food chain, are collected for analysis along with almborne particulates, water, and soil. The enclosed table contains

a list of important food items in the Marshalless diet. A report of survey findings is issued. Periodically, a reassessment of radiological conditions in the stoll is made and a report published. The survey and reporting efforts operate approximately on a one-year cycle. This followup radiological survey will be extended to include Enewetak Atoll and its residents when cleanup and rehabilitation activities in that atoll are completed.

Erookhaven National Laboratory, University of Washington, and the Lawrence Livermore Laboratory are EROA contractors for this work. The budget laval is about 200 to 250 thousand dollars per year. There is a high degree of cooperation among staff of these contractors and frequent publication of findings in BRDA reports and in the scientific literature. The program provides a means for assessing the quality of these environments as related to radiological health and safety of the Pikini and Enewetak people.

Sincerely,

Joe Deal

Assistant Director for Health Protection Division of Safety, Standards, and Compliance
