DOE/NV-209 (Rev.13) May 1993 UC-700

Announced United States Nuclear Tests

July 1945 Through December 1992

Prepared by:

U.S. Department of Energy Nevada Operations Office Office of External Affairs

This publication supersedes DOE/NV-209 (Rev. 12), dated May 1992

This publication has been reproduced directly from the best available copy.

Available to DOE and DOE contractors from:

Office of Scientific and Technical Information P.O. Box 62 Oak Ridge, TN 37831 (615) 576-8401, FTS 626-8401

Available to the public from:

National Technical Information Service U.S. Department of Commerce 5285 Port Royal Road Springfield, VA 22161

Price: Printed Copy A05 Microfiche A01

Announced United States Nuclear Tests

July 1945 Through December 1992

This document lists chronologically and alphabetically by event name all nuclear tests conducted and announced by the United States from July 1945 through December 1992, with the exception of the GMX experiments. The 24 GMX experiments, conducted at the Nevada Test Site (NTS) between December 1954 and February 1956, were "equation-of-state" physics studies that used small chemical explosives and small quantities of plutonium. Several tests conducted during Operation Dominic involved missile launches from Johnston Atoll. Several of these missile launches were aborted, resulting in the destruction of the missile and nuclear device either on the pad or in the air.

On August 5, 1963, the United States and the Soviet Union signed the Limited Test Ban Treaty which effectively banned testing of nuclear weapons in the atmosphere. <u>All</u> United States nuclear tests conducted prior to that date have been announced and are listed in this document. Some tests conducted underground since the signing of the Treaty and designed to be contained completely have not been announced. Information concerning these events is classified. Occasionally, the name and detonation date of an unannounced test is declassified which permits its listing in subsequent revisions to this document.

Data on United States tests were obtained from, and verified by, the Department of Energy's three weapons laboratories -- Los Alamos National Laboratory, Los Alamos, New Mexico; Lawrence Livermore National Laboratory, Livermore, California; and Sandia National Laboratories, Albuquerque, New Mexico. Additionally, data were obtained from public announcements issued by the Atomic Energy Commission and its successors, the Energy Research and Development Administration, and the Department of Energy, respectively.

Test Dates

Time and date for all events listed in this document were converted from local time to Greenwich Civil Time (GCT). The event date listed is the GCT date for the event.

Test Series

Each series of tests is given a name such as Operation Crossroads. United States nuclear tests were conducted on an intermittent basis from June 1946 to October 1958.

On October 31, 1958, the United States entered into a unilateral testing moratorium announced by President Eisenhower with the understanding that the Soviet Union would also refrain from conducting tests. The Soviet Union resumed testing in September 1961 with a series of the largest tests ever conducted.

On September 15, 1961, the United States resumed testing at the NTS on a year-round basis with Operation Nougat. From that time to the present, tests have been grouped for fiscal and reporting purposes according to the fiscal year in which they took place. For example, fiscal year 1963 tests -- which began July 1, 1962, and extended through June 30, 1963 -- were in the Operation Storax series.

Between April and November of 1962, the United States conducted Operation Dominic, which included the Department of Defense (DoD) Operation Fishbowl high-altitude tests, in the Pacific. The DoD also conducted four weapons effects tests at the NTS in July 1962 as Operation Sunbeam.

In 1976, the federal government changed the fiscal year to begin on October 1 and end on September 30. Accordingly, the fiscal year 1976 series, Operation Anvil, did not end on June 30, but was extended through September 30, 1976, a period of 15 months.

Test Yields

The nomenclature for test yields varied according to information policy governing specific years. In some cases, no yield information has been released; in a few cases, the terms "very slight" and "slight" were used without amplification. Except for tests where specific yields or relative specific yields such as "about 2 kt," "several MT," "less than 0.1 kt," etc., were announced, test yields are given in these terms:

1945 through 1963

Low (less than 20 kt) Intermediate (20 to 200 kt) -- all tests except Operation Dominic Intermediate (20 to 1,000 kt) -- Operation Dominic Submegaton (less than 1 MT, but more than 200 kt) Low Megaton (from 1 to several MT) Megaton Range

1964 through February 1976

Less than 20 kt 20 to 200 kt 200 to 1,000 kt March 1976

During a series of high-yield tests conducted during this month, two ranges were added, and the 200 to 1,000 kt range was dropped.

200 to 500 kt 500 to 1,000 kt

Since March 1976

On March 31, 1976, the Soviet Union and the United States agreed to limit the maximum yield of underground tests to 150 kt. The yield ranges now reported are:

Less than 20 kt Less than 150 kt 20 to 150 kt

Test Locations

The first test of a nuclear weapon was in the atmosphere on July 16, 1945, in a remote part of New Mexico on what was then the Alamogordo Bombing Range, and is now the White Sands Missile Range. The site is 55 miles northwest of Alamogordo, New Mexico. At various times between June 1946 and November 1962, atmospheric and underground tests were conducted by the United States in the Marshall Islands, Christmas Island, Johnston Atoll in the Pacific Ocean, and over the South Atlantic Ocean. Between January 1951 and July 1962, atmospheric and underground nuclear tests were conducted at the NTS.

Since July 1962, all nuclear tests conducted in the United States have been underground and most of them have been at the NTS. Some tests were conducted on the Nellis Air Force Base Bombing Range; in central and northwestern Nevada; in Colorado, New Mexico, and Mississippi; and on Amchitka, one of the Aleutian Islands off the coast of Alaska.

Test Types and Purposes

The definition of terms used in this document appears in the Glossary. Type refers to the method of deployment of the nuclear device at time of detonation such as tower, tunnel, airdrop, etc. Purpose indicates whether the test was part of the weapons development program, a DoD effects test, a joint United States-United Kingdom (US-UK) test, or was part of some special program that involved the use of nuclear devices. In the Summary, the sum of all tests conducted underground (tunnel, shaft, and crater events) appears as Total Underground. With the exception of five underwater tests, the remaining events appear as Total Atmospheric.

Test Totals for Nevada Test Site

DOE's Nevada Operations Office, when discussing off-site detection of radiation from tests, sometimes has used the term atmospheric to describe any test where the release of radioactivity to the atmosphere was anticipated and was a factor in test planning. Nineteen were not designed to be contained. See Categorization of NTS Nuclear Tests (page v) for a comparison of test totals listed by the placement criterion used in this document with those listed by the designed to be contained.

Detection of Radioactivity from Nevada Test Site Events

Unless otherwise noted, all nuclear tests at the NTS or the Bombing Range prior to September 15, 1961, produced radioactivity detected off site. • Unless otherwise noted, no test at the NTS or the Bombing Range on or after September 15, 1961, had a release of radioactivity that was detected off site. The release of radioactivity from a test can occur:

- Accidentally as a result of a containment failure.
- Accidentally or deliberately as a result of post-event operations.
- Deliberately as a result of post-event controlled purging of gases from a tunnel.

All releases resulting from a containment failure, even if not detected off site, are reported. Radiation releases resulting from tunnel purging or normal operations are not reported in this document unless detected off site, since they are carefully monitored and do not have an impact on the public.

*See Glossary for definition of "off site."

Future U.S. Tests

In July 1992 the White House announced that future U.S. nuclear tests would be conducted only to ensure the reliability and safety of U.S. deterrent forces. Past tests have been described as being for one of seven purposes (see page viii).

Weapons related tests are conducted to gather data on nuclear devices; weapons effects tests are conducted, usually by the DoD, to determine the effects of nuclear detonations on military offensive and defensive systems. As now mandated by law, the only purpose for a weapons related test is to ensure either the safety or the reliability of U.S. nuclear weapons, and the only purpose for weapons effects tests is to ensure the reliability of U.S. deterrent forces.

The law further stipulates that plans to test for reliability of a specific nuclear deterrent receive Congressional approval prior to test execution. The purpose of tests conducted for the United Kingdom (UK) will continue to be shown as "Joint US-UK." As for U.S. tests, the only purpose is to ensure the safety or the reliability of the UK deterrent. A note following each test entry indicates whether the test was for safety or reliability.

iv

Categorization of NTS Nuclear Tests

	cement Criterion this document)		Containment Design Criterion {sometimes used in public discussion}			
Α.	Atmospheric			A .	Not Designed to be Contained	
	Aboveground NTS Aboveground Bombing Range	100 5	(1) (2)		Aboveground Unstemmed Hole Crater	105 9 10
	Subtotal (Atmospheric)	105			Subtot a i	124
B.	Underground			В.	Designed to be Contained	
	Shaft Unstemmed Hole Crater	9 9	(3)			
	Shaft Shallow Buried Shaft Stemmed Tunnel Subtotal (Underground)	1 535 67 62 1			Shaft Tunnel Subtot al	535 67 602
То	təl	726			Total	726

(1) Consists of 84 weapons related or weapons effects tests and 16 safety tests.

(2) Consists of 4 storage-transportation tests and 1 safety test.

(3) Nine events were conducted underground in unstemmed holes to minimize, but not eliminate, the release of radioactivity to the atmosphere. Because incandescent gases were released, these tests are sometimes referred to as "Roman candles."

(4) Ten tests were designed to be cratering tests, hence not designed to be contained. Event named Sulky, conducted on December 18, 1964, failed to produce the expected crater, but because placement was in a shaft, albeit shallow, it is listed in this document as a shaft test.

Glossary

white a state as

Airburst	The explosion of a nuclear weapon at such a height that the expanding fireball does not touch the earth's surface prior to the time the fireball reaches its maximum luminosity. The airburst reported in this document resulted from the detonation of a device fired from a 280mm cannon.
Airdrop	A nuclear device dropped from an aircraft and exploded in the atmosphere.
Atmospheric	A test conducted aboveground or above water; i.e., in the open air.
Balloon	A nuclear device suspended from a balloon and exploded in the atmosphere.
Barge	A nuclear device exploded from a barge moored in the lagoon at Enewetak or Bikini.
Crater	A nuclear device placed shallow enough underground to produce a throw-out of earth when exploded.
Joint US-UK	A nuclear test conducted jointly by the United States and the United Kingdom under a cooperative agreement in effect between the two countries since August 4, 1958.
kt	A kiloton. The energy of a nuclear explosion that is equivalent to an explosion of 1,000 tons of TNT.
MT	A megaton. The energy of a nuclear explosion that is equivalent to an explosion of one million tons of TNT.
NTS	The Nevada Test Site, a 3,510-square-kilometer (1,350-square-mile) area in southern Nevada in Nye County and about 104 kilometers (65 miles) northwest of Las Vegas.
Off Site	Off site is any place outside the Test Range Complex, an area that includes both the Nevada Test Site and the adjacent Government-controlled Nellis Air Force Range.
On Site	A notation that radioactivity was detected on site only is made for any test from which there was an unplanned release of radioactivity into the atmosphere that was not detectable beyond the boundaries of the Test Range Complex.
Plowshare	Application of nuclear explosives to develop peaceful uses for atomic energy. The program is no longer active.
Rocket	A nuclear device launched by rocket and exploded in the atmosphere.
Safety Experiment	Experiment designed to confirm a nuclear explosion will not occur in case of an accidental detonation of the explosive associated with the device.

Seismic Calibration	A nuclear test to evaluate seismic effects of an underground explosion.
Shaft	A nuclear device exploded at the bottom of a drilled or mined vertical hole. Some safety tests were set off at the bottom of unstemmed drilled holes, producing a "Roman candle" effect.
Storage-Transportation	Detonations of combinations of high explosives and nuclear materials designed to study distribution of nuclear materials during accidents in several transportation and storage configurations.
Surface	A nuclear device placed on or close to the earth's surface.
Ton	Equivalent to a ton of TNT.
Thermonuclear Device	A "hydrogen bomb."
Tower	A nuclear device mounted at the top of a steel or wooden tower and exploded in the atmosphere.
Tunnel	A nuclear device exploded at the end of a long horizontal drift mined into a mountain or mesa in a way that places the burst point deep within the earth.
UG	Underground nuclear test conducted in a tunnel or at the bottom of a drilled hole or shaft. Some underground nuclear tests were not designed to contain all radioactivity; e.g., cratering tests or safety experiments.
UW	A nuclear test conducted underwater.
Vela Uniform	Department of Defense (DoD) program designed to improve the capability to detect, identify, and locate underground nuclear explosions.
Verification event	An event on which the Russian government exercised its right to verify under the terms of the Threshold Test Ban Treaty.
Weapons Effects	A nuclear test to evaluate the civil or military effects of a nuclear detonation on various targets, such as military hardware.
Weapons Related	A nuclear detonation conducted for the purpose of testing a nuclear device intended for a specific type of weapon system.
Yield	The total effective energy released in a nuclear explosion. It is usually expressed in terms of equivalent tonnage of TNT required to produce the same energy release in an explosion.
