Dr. Robert A. Conard Jr.
Medical Division
Brookhaven National Laboratory
Associated Universities, Inc.
Upton, Long Island, New York

Dear Dr. Conard:

I am enclosing a corrected table of the data on the Marshall Island food samples. The correction only applies to the calculation of the overall level of Strontium-90 in the diet. This figure should have been calculated at about 300 Strontium Units rather than 900.

In addition, the table has been somewhat rearranged but none of the original data has been changed.

Dr. Dunning has questioned the relative calcium values found on these and previous surveys. In going through past data it appears there have been some large spreads in calcium value. Part of this has been due to lack of a standard wet weight basis and I feel that the present samples which were carefully prepared to represent the food as eaten are the best we have. In any case, the usual comparisons are on the basis of Strontium Units and I know that these, of course, would not be changed since both calcium and strontium are calculated to the same base.

Sincerely,

John H. Merley, Chief
Analytical Branch
