MARINE LANDING AND BEACHING INFORMATION
FOR ALL SITES
ENIWETOK ATOLL

ALICE — LCMs and LCUs beach on sand bar through break in reef. Require plus 1.5 tide or under. Tracked equipment and vehicles only.

Channel Markings: None at present.

CLARA — LCMs beach on sand bar through break in reef. Require plus 1.5 tide or under. Tracked equipment and vehicles only.

Channel Markings: None at present.

GENE
HELEN
IRENE — Causeway out between HELEN and GENE. Landings for LCUs and LCMs on west side of GENE. LCMs can beach at IRENE but require a plus 2.5 tide. IRENE and HELEN connected by causeway. Old channel at GENE useable but not recommended.

Channel Markings: None.

JANET — LCMs and LCUs at any tide.

Facilities: Hard sand ramp. (Note: Freight pier in damaged condition, not recommended for use until repairs made.)

Channel Markings: None.

KATE — LCMs requirea plus 1.5 tide and LCUs require a plus 3.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

LUCY — LCMs require a plus 1.5 tide and LCUs require a plus 3.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None

~~OFFICIAL USE ONLY~~

MARINE LANDING AND BEACHING INFORMATION FOR ALL SITES (Cont'd)

MARY

LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

NANCY
OLIVE
PEARL

LCT (Only) require a plus 2.0 tide.

Facilities: Sandy and coral beach landing.

Channel Markings: None.

RUBY
SALLY
TILDA
URSULA

Connected by causeway. Entrance channel at URSULA. LCMs and LCUs can enter at any tide.

Facilities: Freight pier and concrete ramp.

Channel Markings: One lighted entrance buoy (Fl.-W.) and eleven channel buoys. (Oil drums; 6 red and 5 black.)

Note: The channel to the causeway landing between TILDA and URSULA and the channel to the damaged pier at SALLY have sanded in and are not being used. (Some old channel marking buoys are still in place.)

WILMA

LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

YVONNE

LCMs, LCUs, and LTLs (Tugs) can enter at any tide.

Facilities: Freight pier and [illegible] concrete ramp.

Channel Markings: One lighted entrance buoy (Fl. W.).

~~OFFICIAL USE ONLY~~

~~OFFICIAL USE ONLY~~

MARINE LANDING AND BEACHING INFORMATION FOR ALL SITES (Cont'd)

ZONA — DUKW's only.

ALVIN
BRUCE
CLYDE

LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

DAVID

LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier and a sandy beach landing.

Channel Markings: None.

ELMER

LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier, personnel pier and two concrete ramps.

Channel Markings: None.

FRED

LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier, personnel pier, 40 feet concrete ramp by personnel pier and sand ramp by freight pier.

Channel Markings: One clearance buoy just off the personnel pier.

GLASS
HENRY
IRWIN
JAMES
KEITH

LCMs (Only) require a plus 2.0 tide.

Facilities: Some coral beach landing. (Rocky in spots.)

Channel Markings: None. (Note: Not used very much.)

~~OFFICIAL USE ONLY~~

~~OFFICIAL USE ONLY~~

MARINE BEACHING AND LANDING INFORMATION FOR ALL SITES (Cont'd)

LEMOY

LCMs require a plus 2.0 tide and LCUs require a plus 4.0 tide.

Facilities: Sandy beach landing

Channel Markings: One large nun buoy (Red #2) and four other channel buoys (oil drums) (3 red and 1 black).

Note: Red nun buoy #2 serves also as a mooring buoy for LCMs. Keep all red buoy close to starboard when entering channel. Beaching area is between the last red buoy (#8) and only black buoy (#7).

OSCAR

LCMs (Only) at any tide.

Facilities: A ladder is at the southeast side of tower.

Channel Markings: None.

MACK

LCMs and LCUs at any tide.

Facilities: Landing platform is at the north side of tower base.

Channel Markings: None.

JOB NO 942
SHEET 1 OF
BY ES DATE

TITLE HEIGHT OF TIDE AT ANY TIME

Obtain from the predictions the high water and low water, one of which is before and the other after the time for which the height is required. The difference between the times of occurrence of these tides is the duration of rise or fall, and the difference between their heights is the range of tide. Find the difference between the time of the nearest high or low and the time for which the height is required. (Cont'd at bottom of page)

Enter the table with the duration of rise or fall, which most nearly agrees with the actual value, and on that horizontal line find the time from the nearest high or low water which agrees most nearly with the corresponding actual diff. The correction sought is in the,

TIDE TABLES

ENIWETOK ATOLL, MARSHALL ISLANDS

1957

This tabulation is extracted from "Tide Tables, Central and Western Pacific Ocean and Indian Ocean, 1957", and published by the U.S. Department of Commerce, Coast and Geodetic Survey.

Datum, elevation 0.0, is defined in the above publication as follows: "Heights are reckoned from the datum of soundings on the largest scale charts of the locality which is ½ foot below mean low water springs" for Kwajalein Atoll, Marshall Islands.

The reference station is Kwajalein Atoll, time meridian 180 degrees east. The following tabulation appears in Table 2. - Tidal Differences and ranges:

	Lat	Long.	Time	Ranges	
				Mean	Spring
Eniwetok Atoll	11° 21'	162° 21'	-05 min.	2.7'	3.9'

Range is the difference between successive tides, i.e., between a high and a low or a low and a high. Mean range is the average range of all tides in the year. Spring range is the average of the largest ranges in the year. Springs occur once each lunar month (approximately 28 days) when the highest highs and the lowest lows are recorded.

The values in this tabulation are based on average weather conditions. Unusual weather, particularly high winds from a direction other than seasonally normal, affect both the times and the heights.

Each site in the Atoll has a slightly different time and height of highs and lows. This can be disregarded for all practical purposes in the lagoon. The water level on the ocean reef is always higher than that of the lagoon, the difference varying from a few tenths to 1.5'.

BUILDING & STRUCTURE NUMBERS

HOLMES & NARVER, INC.

REVISED TO 1 OCT. 1956

MISC. 415

NOTE: Any corrections or changes to this list should be made only on the master list which is maintained in the Office Engineering & Design Department of the Engineering Division

~~OFFICIAL USE ONLY~~

GENERAL NOTES

1. For further information on sizes and types of buildings, refer to the As-Built Drawings.

*2. Column denoted by an asterisk contains numbers which represent General Layout Drawing Number or area on which building appears on the new 1" - 50' topographic sheets.

3. The building numbers in this index pertain to Holmes & Narver Plans, General Layouts and Survey notes.

4. Symbol beside building number (M) indicates Military owned building or structure.

5. Symbol beside building number (C) indicates A.E.C. owned building or structure that is capitalized, or, Construction-Work-Is-In-Progress.

SITE ELMER

BUILDING & STRUCTURE NUMBERS

HOLMES & NARVER, INC.

REVISED TO 1 OCT 1956

MISC. 416

NOTE: Any corrections or changes to this list should be made only on the master list which is maintained in the Office Engineering & Design Department of the Engineering Division.

GENERAL NOTES

1. For further information on sites and types of buildings, refer to the As-Built Drawings.

*2. Column denoted by an asterisk contains numbers which represent General Layout Drawing Number or area on which building appears on the new 1" = [illegible] topographic sheets.

3. The building numbers in this index [illegible] Balance & Survey Plans, General Layouts and Survey [illegible].

4. Symbol beside building number (M) [illegible] military owned building or structure.

5. Symbol beside building (C) indicates [illegible] owned building or structure that is capitalized, [illegible] Work-In-Progress.

TIDE TABLE

BIKINI ATOLL, MARSHALL ISLANDS

1957

This tabulation is extracted from "Tide Tables, Central and Western Pacific Ocean and Indian Ocean, 1957", and published by the U.S. Department of Commerce, Coast and Geodetic Survey.

Datum, [illegible], is defined in the above publication as follows: "Heights are reckoned from the datum of soundings on the largest scale charts of the locality [illegible] for Bikini Atoll, Marshall Islands.

The reference station is [illegible] Atoll, [illegible] meridian 180 degrees east. The following information appears in [illegible] Tidal differences and ranges:

				Ranges	
	Lat.	Long.	Time	Mean	Spring
Bikini Atoll	11° 36'	165° 33'	+20 min.	3.4'	4.9'

Range is the difference between consecutive tides, i.e., between a high and a low or a low and a high. Mean range is the average range of all tides in the year. Spring range is the average of the largest ranges in the year. Springs occur each [illegible] month (approximately 14 days) when the highest highs and the lowest lows are reached.

The values in this tabulation are based on average weather conditions. Unusual weather, particularly high winds from a direction other than normally normal, affect both the times and the heights.

Each site in the atoll has a slightly different time and height of highs and lows. This [illegible] is disregarded for all practical purposes in the lagoon. The water level on the ocean reef is [illegible] than that of the lagoon, the difference [illegible].

HORIZONTAL CONTROL SURVEY

Specifications and Procedure

The basis of classification of horizontal control surveys is the accuracy with which the length and azimuth of a line are determined. Since it is impossible to ascertain the absolute error, it is essential that the procedure in executing the survey conform to standards which have been established as the result of extensive experimentation and research. For this reason the triangulation survey of this department will follow the specifications and procedure of the U. S. Coast and Geodetic Survey.

Specifications and procedure for each phase of the work and much other information of value is contained in Special Publication No. 247, Manual of Geodetic Triangulation published by the USC&GS. This manual will be the textbook for precise surveys, and personnel involved in these surveys should familiarize themselves with the contents. The following is a summary of the procedure involved in making a survey, and is not intended as a substitute for reference to the manual.

Generally, the order of accuracy and the points whose interrelation are required will be specified by the Client. The approximate locations of the triangulation stations will be determined based on reconnaissance and conformance to strength of figure requirements. Instructions including the above information will be issued to the field for execution of the survey.

<u>Reconnaissance</u>. Before observing can be initiated, the stations must be physically established and, if necessary, observing towers erected. Intervisibility of stations must be determined, and the location and height of towers so established that the line of sight has a minimum vertical clearance of ten feet from any object. The minimum safe clearance both vertical and horizontal is dependent on atmospheric conditions, and reference to S.P. 225, Manual of Reconnaissance for Triangulation, is recommended for information on the subject. Formulas and a table for determining intervisibility will be found in S.P. 247, page [illegible]. The computed heights of towers to compensate for the earth's curvature and refraction plus ten feet will give the actual height of towers.

<u>Reference</u>. The following references that are published by the U.S. Coast and Geodetic Survey should be available at all field offices where precise triangulation is to be accomplished. The chapters on triangulation contained in many textbooks are based on information from these manuals.

S.P. 247, Manual of Geodetic Triangulation
S.P. 225, Manual of Reconnaissance
S.P. 120, Manual of First Order Triangulation
S.P. 145, Manual of Second Order Triangulation
S.P. 138, Manual of Triangulation Computation
S.P. 8, Formulas and Tables for the Computation of Geodetic Positions

S.P. 120 and 145 are superseded by S.P. 247, but do contain more detail on some subjects.

INSTRUCTIONS FOR USE OF THE WILD T-3 THEODOLITE

(Issued by the U.S. Coast and Geodetic Survey)

These instructions are intended for the Wild T-3 Theodolite, but contain information applicable to the Wild T-2.

1. Unpacking and setting up of the Instrument. The case is set up with the felt to the rear, and then both lateral screws of the base plate are unscrewed. The hood is then carefully lifted and the two clamping levers are unloosed. The base plate which is fastened to the frame with a milled screw, is taken out and set on the stand, centered, the three levers are pulled out, the theodolite is set in and the tribrach screws are held fast with the clamping levers.

2. Leveling. The centering is not changed anymore by leveling, since the point of support of the plumb bob is the plane which passes through the tips of the tribrach screws.

The theodolite should be turned several times about the vertical axis and the telescope transmitted before starting to observe.

3. Focussing. The focussing of the eye piece is done by turning the black milled ring until the crosswires become very sharp and black, while the telescope is pointed on a moderately bright background. A person should observe and remember the setting of the ring on the numbered scale, and then use this for future focussing. To focus on the image of the sighting point, turn the nickel focussing ring (testing for freedom of parallax between image and crosswires, by movement of the eyes). For the focussing of the reading microscope, the milled black ocular tube, at the side of the telescope is turned until the graduations of the circle become sharply defined.

By changing eye-pieces, a person may work with magnifications of 24, 30 or 40; normally, the magnification of 30 should be used, and this eye-piece should also be used for the zenith prism.

4. Reading the circle. The horizontal and vertical circles are read in the microscope, adjoining the telescope, on the right, next to the slow motion screw for the vertical circle [illegible] the milled head screw for the inverting contrivance. By turning the screw clockwise until it stops, the horizontal circle becomes visible in the microscope; then by turning it counterclockwise the image of the vertical circle becomes visible.

The illumination of the circles should be as bright and as equally illuminated as possible. To do this, the illuminating prisms are turned. During the measurement of an angle, the illumination should not be changed. In the reading microscope appear the images of the diametrically opposite portions of the circle, separated by a fine horizontal line, [illegible] the scale image of the second drum.

5. Horizontal Circle Readings. The horizontal circle is graduated to 4 minutes, and is read (after coincidence), by means of the index, to 2 minutes. The lower row of [illegible] figures [illegible] read.

To this circle [illegible] reading of the seconds drum, since the drum [illegible]. The drum [illegible] numbered by tenths from 0.0 to 60.0, but this [illegible] single drum reading is only half the [illegible] before being added to the circle reading. [illegible] of the drum should be taken and the sum of the two [illegible] to the circle [illegible] accomplishing the same result as multiplying [illegible] the added accuracy of two micrometer readings [illegible] will make this clear:

Circle reading		Seconds Drum			Total Reading		
°	'	1st read.	2nd read.	sum	°	'	"
104	58	6.8	[illegible]	13.7	104	58	13.7
119	10	[illegible]	[illegible]	82.1	119	11	22.1
140	20	[illegible]	[illegible]	39.8	140	20	39.8
158	30	[illegible]	[illegible]	66.3	158	31	06.3
172	52	[illegible]	[illegible]	14.0	172	52	14.0
0	12	47.9	47.8	95.7	0	13	35.7
43	28	39.0	[illegible]	78.1	43	29	18.1

Since only two [illegible] instead of six as in 3-micrometer instruments, greater care and greater [illegible] of drum readings must be taken with the two readings [illegible] 3-micrometer theodolites.

The seconds drum [illegible] seconds (0.2 seconds) and all readings should be [illegible]. Record the sum of the two readings, also the [illegible] and the direction to the nearest tenth of second.

Experience [illegible] two careful micrometer readings will seldom be grea[illegible] seconds) and generally no more than 0.1 double [illegible] readings vary by more than 0.3 double seconds, [illegible] two concordant readings are obtained.

[illegible] Vertical [illegible] circle bubble before reading [illegible]

Direct [illegible]

Reverse [illegible]

Difference [illegible]

With vertical [illegible]

Vertical [illegible] elevation. depression

With vertical [illegible]

Vertical [illegible] elevation. depression

Records. Forms are provided for each specific item recording the results of observing and computing. These records should be kept on transparencies in order that reproductions can be made of all records of the survey.

All computations which are required to complete these forms should be included in the records of the survey. They should be recorded in an orderly manner, and in sufficient detail that the computations can be checked at the Home Office. References should be made to field books, map compilation data used in computing the survey.

7. Electrical Illumination. There are two sources of illumination:

(a) That for the horizontal circle,
(b) That for the vertical circle and cross wires.

The second drum is illuminated by the light from whichever circle is being read. The horizontal circle lamp is the one which has three wires attached to it; The vertical circle lamp is the one which has two wires. Remove the horizontal and one vertical illumination prisms and place them in the clips in the base plate of the instrument case before installing the electrical illumination devices.

The cross wires are illuminated by a small prism inside the telescope which intercepts part of the light which goes to the vertical circle. This prism has no adjustment.

A rheostat may be installed in the circuit for regulating the cross-wire illumination. Tests should be made to see where it should be installed between the battery and horizontal circle lamp or between the horizontal and vertical circle lamps. When the consensus of opinion has been established, a permanent rheostat can be attached if necessary.

To switch off the electric current, pull out one of the small pins at the end of one of the wires of the horizontal circle illuminating attachment.

A very important point is the illumination of the horizontal circle. A diffused light is essential, and this diffusion is not provided by the frosted bulbs, provided with the instrument, to the desirable degree. Bulbs should be painted white, or a piece of paper should be placed over the end of the lamp tube for the illumination of the horizontal circle to give the required diffusion. Permanent changes will be made when field engineers have given the problem their attention. In the meantime a tube of white paint and a bottle of shellac should be carried by field men for painting bulbs.

Flashlight bulbs for circle illumination of either 2.5 or 3.8 volts may be used. The latter will likely be found preferable. Number 6 dry cells will be found more reliable for illumination current than the batteries supplied in a case with some of the theodolites. Some bulbs apparently have the wrong screw thread and size of bulb to fit into the receptacle. Before leaving for the field select proper spare bulbs for emergency.

8. Other Points. Watch out for drift in the horizontal circle. Every few nights close the circle in four positions by closing on the initial at the end of the half set.

Carry the theodolite upright when in the carrying case; do not let this case rest on its side. The theodolite is fastened in the case by the bottom only, and if it rests on its side any strain will be taken on the upper part of the vertical axis, an undesirable condition.

Laboratory tests indicate that the telescope definition drops considerably when the telescope is not exactly focussed. It is therefore desirable to exactly focus the telescope on a star, after the cross wires are focussed and always use the telescope at that focus for precise work. After the exact focus is obtained put a scratch across the edge of the focussing ring and the adjacent part of the telescope tube, so that exact focus may be obtained or checked at any time.

9. Description of [illegible]

Effective aperture [illegible] ([illegible]/8 inches)
Magnification (3 eye[illegible]) [illegible], 23.4 and 38.5
Length of telescope [illegible] mm. (10 inches)
Sensitivity of plate level, appro[illegible] 7 [illegible] per division
Sensitivity of vertical [illegible] level, [illegible] per 2 mm.
(The coincidence [illegible] doubles the accuracy of centering.)
Magnification of reading microscope [illegible]
Diameter of horizontal circle [illegible] (5[illegible] inches)
Diameter of vertical circle [illegible] mm (3 [illegible]/4 inches)
Division of horizontal circle [illegible]
Division of vertical circle [illegible] double [illegible] minutes. (really 8 minutes)
Value of smallest division [illegible] seconds, really 0.2 seconds
Vertical circle bubble [illegible] of the horizontal wire.

Weight of	instrument	[illegible].5 kg.	(25.3 lbs.)
" "	case	[illegible].9 kg.	(12.9 lbs.)
" "	tripod and accessories	7.[illegible] kg.	(16.5 lbs.)
Resolving power	(24X eyepiece)	[illegible]	
" "	(30X ")	[illegible]	
" "	(40X ")	[illegible]	

10. <u>Zenith prism.</u> This prism is [illegible] for astronomic observations. The Zenith prism is a [illegible] magnification eyepiece is to be used for it.

11. <u>Packing the instrument.</u> The [illegible] of the base plate are released, the instrument is lifted out and set on the base plate of the packing box. In front on one of the supports of the tribrach screws is a nickel mark. A similar mark is on the front [illegible] of the base plate, [illegible] instrument must be so set in, that these two marks correspond, then the [illegible] are closed. The telescope is turned over until the eyepiece almost [illegible] standards, the standards are turned in the horizon [illegible] way that the eyepiece comes over the two marks. The clamping screws for the vertical circle and the horizontal circle are moderately tightened. The base [illegible] with the levers [illegible] in is again attached to the standards or it may be left [illegible] closing the hood, the two screws for tightening [illegible]

NOTE: Paragraphs [illegible] furnished with the T-2 theodolite [illegible]

Observing Procedure

Wild T-2 or T-3 Theodolite

Specifications of the USC&GS require a set of sixteen positions to be observed for first order triangulation, and six to twelve for second order. Recommendations of the local office of that organization are that for average conditions eight positions be observed for second order triangulation.

The initial settings of the circle for the eight and sixteen position sets are as follows. It is not necessary to set the circle nearer than about one-half minute to the setting given.

8 Position

(1)	D	0°	00'	10"
(2)	R	202	00	25
(3)	D	45	00	35
(4)	R	247	00	50
(5)	D	90	00	10
(6)	R	292	00	25
(7)	D	135	00	35
(8)	R	337	00	50

16 Position

(6)	R	236	00	25	(14)	R	326	00	25
(7)	D	67	00	35	(15)	D	157	00	35
(8)	R	258	00	50	(16)	R	348	00	50

After completion of the direct reading on the initial light, direct pointings and readings are made in turn clockwise on each additional light of the schedule. Then the telescope is plunged and pointings and readings made on the lights in the reverse order to and including the initial light. This completes position number one. With the telescope remaining reversed, the circle is set for position two, and pointings on the initial and other lights are made in the same manner as for position one. This procedure is repeated until the required number of positions have been observed. The rejected positions are reobserved.

It frequently happens that one or more lights are not visible during all or part of the time the observations are being made upon the other stations. Little time should be spent waiting for a light to show. The position missed can be observed later, using the same initial as was used during the first series, or some other main scheme station observed upon during that series.

Every effort should be made to complete satisfactory sets to all required stations while occupying a station, as a reoccupation will generally mean another night's work if the observing station is [illegible].

Rejection of Observations

The greater part of the time involved in the observing program is in preparation to observe, transportation, building up, adjusting lights, etc. Once ready to go, any refinement in observing which may help to decrease the probability of re-observing a station is well justified. A rigorous application of the rejection limits to observations, even though the quantities rejected are just outside the limit, will result in a saving of time and effort.

The following is a summary of rejection rules as applied by the USC & GS, and may be found in more detail in S.P. 247, pages [illegible], [illegible] and [illegible].

(1) Any measurement of a direction deviating by more than four seconds from the mean for first-order triangulation, and by more than five seconds for second order, must be rejected and re-observed using the same position setting.

(2) In applying the rejection limit the mean value of a direction should be rounded off to the nearest tenth of a second, and the criterion applied to each observation to a tenth of a second.

(3) If any observations are so far from the approximate mean as to obviously exceed the limit, these should be rejected before taking the trial mean and that position re-observed.

(4) No reading should be rejected if it falls within the limit of retention unless rejected at the time of observation.

(5) A trial mean is taken, and using the rejection limit any observation (including the individual ones forming a position mean) which differs by more than the limit from the trial mean is rejected. The rejected positions are re-observed.

(6) After a trial mean is obtained and the rejection limit applied, none of the observations rejected should be again included even though the new mean would bring them within the limit of rejection.

(7) Using a new mean, the rejection limit is again applied. If any of these observations fall outside the rejection limit they are rejected, and new observations and new means taken until all accepted positions are within the limits of the final mean.

(8) If one reading of two or more on a position falls without and one within the limit of rejection, do not use the mean even though it comes within the limit. Use instead only the reading within the limit and reject the other.

(9) If two readings fall without the limit, one being abnormally high and the other abnormally low, and the mean falls within the limit, both readings should be rejected.

(10) If two or more readings have been taken for a single position, the mean should be used if the readings are within the limit of retention.

(11) Occasionally conditions will be encountered which make it difficult to bring all readings within rejection limits. There will be no abnormal spread in direct and reverse readings, but the position mean will be well within the limit, or the number of rejections is averaging much in excess of ten percent of the entire number of observations, the rejection limit may be increased. Before this is done, every effort should be made to determine the cause of the large range.

Record of Horizontal Directions

The following Record of Horizontal Directions contains the field record of observing an eight-position set to second-order specifications. It is followed by an "Abstract of Directions" which contains the position directions and the mean of the eight positions on each direction.

The process of establishing the mean direction of a position may be understood by a study of the record for position number one.

(a) The direct and reverse readings are meaned for each observed station.

(b) The initial and closing mean readings on the initial station are meaned.

(c) The mean reading on the initial station established by a and b is subtracted from the mean D and R for each successive observed station to establish the direction for that position.

A trial mean is established by dividing the sum of the directions for each of the eight positions by the number of positions. In this case (see Abstract of Directions) 40.0" for station Baker and [illegible] for station [illegible].

With these trial means each position is checked for compliance with rejection limits. Two examples of rejection follow:

Position No. 4. The trial mean for direction Baker is 40.0". It is obvious that [illegible] is outside the five second rejection limit.

The mean D/R for a direction of 40.0 is obtained by subtracting the difference between the direction and mean D/R for Baker at this position, or: [illegible]

It is then found that the direct reading [illegible] is within limits and that the reverse reading [illegible] is outside the limits and is rejected. 21.[illegible] is accepted for the mean D/R.

Position No. 7. The reading direction of [illegible] is obviously outside the five-second rejection limit of [illegible]. [illegible] The direct and reverse readings of [illegible] and [illegible] are both outside the limits so the position is rejected and is reobserved (see bottom of the same page).

In the Abstract of Directions a line is drawn through the original direction for Position 4 of [illegible] and the new direction of [illegible] is entered. The new direction for Position 7 of [illegible] is entered in the same manner.

A new mean direction is established and a check is made of the positions to determine that the directions for all positions and all position mean D/R's are within the limits of this final mean.

It will be found that the recorder can easily see approximate trial mean as the successive positions are observed, and spot any readings which are obviously outside limits. This permits reobserving these stations before establishing a trial mean, and will result in a saving of observing time. For instance, position directions of 56.4, [illegible] and 60.9 were recorded for the first three positions on Baker. When a direction of [illegible] was determined for Position 4, a rejection was indicated.

Computing Procedure

Triangle Closure. Requirements for triangle closures are that the maximum error in closure of any triangle shall not exceed three seconds for first order, five for second, and ten for third order, and that the average triangle closure where triangulation is being expanded by a network of figures shall not exceed one second for first order, three for second, and five for third order. (See S. P. 247, page xvii.)

Abstract of Directions. An Abstract of Directions will be kept as a part of the observing procedure for each station, and will list the direction for each position, the sum and the mean directions. (S.P. 247, pages 26, 148 to 150.)

List of Directions. The List of Directions will generally list only the mean directions from the occupied station to each observed station. Where an eccentric instrument or light is involved the eccentric reduction and corrected direction to the true station will be shown. (S.P. 247, pages 153 to 157.)

Triangle Computations. The form for triangle computations is set up to record the computation of the four triangles of a quadrilateral on one sheet. The newly used station is always numbered 1, and the other stations numbered 2 and 3 in a clockwise order, with the line 2-3 being the known line. The procedure in computing the triangles is explained in S.P. 247, pages 157 to [illegible].

Spherical Excess. The spherical excess in a figure is not considered in computing a plane triangle, but the spherical angle will be required in computing the geographic position. The spherical angle is larger than the plane angle, and the correction should be computed as explained in S.P. 247, pages 162, 272 and 273.

Side Checks. In the computation of a quadrilateral there are always three lines which have two determinations of their lengths. One of the requirements of triangulation is that the difference between the two values for the logarithm of the length of a line be no greater than two times the logarithmic difference for one second of the smallest distance angle involved in the computation of either value for first order triangulation, and twice the amount for second order.

These side checks are the final indication of the quality of the observed angles, as it is possible for the triangles of a quadrilateral to close within the prescribed limits and not meet the requirements of the side check. The side check condition should be satisfied before observing of a quadrilateral is considered complete, as re-observing may be necessary.

Side equation tests should be made when the closures are large in order to isolate the direction that is faulty. (See S.P. 247, pages 30, 159 to 171, and xvii.)

Geographic Positions. The geographic positions of the stations should be computed at the [illegible] as an additional check on the accuracy of the

previous computations. A description of the [illegible] is given in C.S. 8, Formulas and Tables for Computation of Geodetic Positions. The latitude functions listed therein are necessary in computing the positions. (See also C.S. 247, pages 175 to 179.)

Triangulation Adjustment. The procedures outlined to this point is normally considered as included in the observing and field (or jobsite) computing. Due to the limited extent of the schemes surveyed by this organization, it is benerally considered that when the side conditions have been satisfied further adjustment is not practical. On surveys where a coordinate system will be established and it is desirable that the values of a station remain exactly the same, independent of the direction of computation through the net, an additional adjustment is applied.

This refinement results in slight changes in the values, and a full least square adjustment is not considered practical for a limited scheme. A modified adjustment which meets the requirements of small schemes is included in this set of instructions.

COORDINATE SOLUTION OF THE THREE POINT PROBLEM.

The following solution of the three point problem is due to Mr. W. O. Byrd, formerly Chief of the Computing Section, Division of Surveys, of the Tennessee Valley Authority, Chattanooga, Tennessee.

In the figure are shown the three points with known coordinates, indicated by the subscripts, and the point whose unknown coordinates X, Y, are to be determined. The first step is to shift the origin of coordinates to the point X_3, Y_3, obtaining:

$X'_3 = Y'_3 = 0$

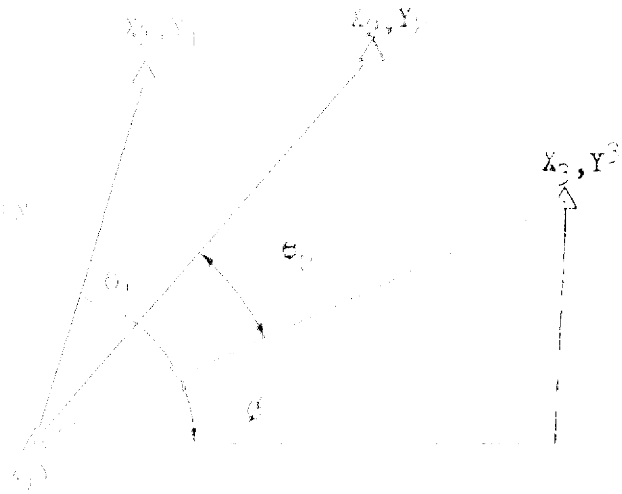
$X'_1 = X_1 - X_3$

$Y'_1 = Y_1 - Y_3$

. . . .

$X' = X - X_3$

$Y' = Y - Y_3$



From the figure, tan $\phi = \frac{X'}{Y'}$, and by trigonometry

$$\tan(\phi + \theta_1) = \frac{\tan\phi + \tan\theta_1}{1 - \tan\phi\tan\theta_1}$$

$$\tan(\phi + \theta_2) = \frac{\tan\phi + \tan\theta_2}{1 - \tan\phi\tan\theta_2} \text{ or}$$

$$\frac{Y'_1 - Y'}{X'_1 - X'} = \frac{\frac{X'}{Y'} + n}{1 - [illegible]} = \frac{X' + nY'}{Y' - nX'} \text{ and}$$

$$\frac{Y'_2 - Y'}{X'_2 - X'} = \frac{\frac{X'}{Y'} + m}{1 - [illegible]} = \frac{X' + mY'}{Y' - mX'}, \text{ where } \tan\theta_1 = n \text{ and } \tan\theta_2 = m$$

Clearing of fractions:

$(Y'_1 - Y')(X' + nY') = (X'_1 - X')(Y' - nX')$

$(Y'_2 - Y')(X' + mY') = (X'_2 - X')(Y' - mX')$

Performing the indicated multiplications:

[illegible]

Collecting terms and dividing the first equation by n, the second by m:

$(Y'^2 + X'^2) - X'(Y_1' - A_1') - Y'(Y_1' + A_1') = 0$ ....(1)

$(Y'^2 + X'^2) + X'(Y_2' - A_2') - Y'(Y_2' + A_2') = 0$

Setting the second factors of the second and third terms in the above equations equal to A, B, C and D, we have:

$A = Y'_1 \cot \theta_1 - X'_1$; $B = Y'_1$ [illegible]; $C = Y'_2 \cot \theta_2 - X'_2$; $D = Y'_2 + X'_2 \cot \theta_2$

Subtracting the second of the equations (1) from the first:

$X'(A - C) - Y'(B - D) = 0$

$Y' = X' \frac{C - A}{D - B} = X'R$ where $R = \frac{C - A}{B - D}$

Substituting this value of Y' into the first of the equations (1) we have

$X'^2(R^2 + 1) + X'A - X'RB = 0$ whence

$X' = \frac{RB - A}{1 + R^2}$

And finally: $X = X' + X_p$; $Y = Y' + Y_p$

The quantity R furnishes a measure of the "strength" of the solution, the problem becoming indeterminate as R approaches the form 0/0. For example, if X'_1, Y'_1, X'_2, Y'_2 are of the order of several thousand feet, and C - A and D - B are of the order of 50 or 100 feet, the point X is close to the circle passing through the known points, and the solution is weak.

The only formal [illegible] involved in this solution is taking two cotangents from a table of natural functions. For [illegible] values of the angles, these functions might become very large, making the solution [illegible]. This difficulty can be avoided by so selecting the initial line as to keep these functions down to a reasonable figure generally less than [illegible].

R might in some cases come out very close to zero, or become practically infinite, should the point X, Y lie almost North or [illegible] of X_p, Y_p. However these difficulties seldom arise in practice. In several hundred three point solutions the writer has had to reject perhaps half a dozen fixes [illegible], and has never had to shift the initial line to get a finite value for R.

When a large number of three point determinations are to be made, it is well to solve them on a mimeographed form such as that on which the following problem is solved; has been found highly satisfactory. The first step is to enter the coordinates of the known points in the appropriate places in the [illegible] part of the form. After the unknown coordinates have been found the coordinates [illegible] are entered, and the solutions checked by inversing between X_p, Y_p and each of the known points. The difference in the azimuths of these lines should check the observed angles. Space is provided for the fourth point which should be observed whenever possible, both as a check on the fix as well as the method, and for possible use in the event that the solution based on the selected three points should prove to be weak.

The solution differs from the derivation [illegible] in that we solve first for Y instead of X. The solution can be greatly expedited by omitting those lines not marked (#) by carrying the work in the computing machine.

CORRECTION FOR SPHERICAL EXCESS

Since the measured angles are spherical angles, each triangle will contain more than 180°; the amount greater than 180° is termed the spherical excess and about one second for each 75 square miles of area of triangle. More exactly, the total spherical excess for each triangle is obtained by the formula (see Special Publication No. 8, p. [illegible])

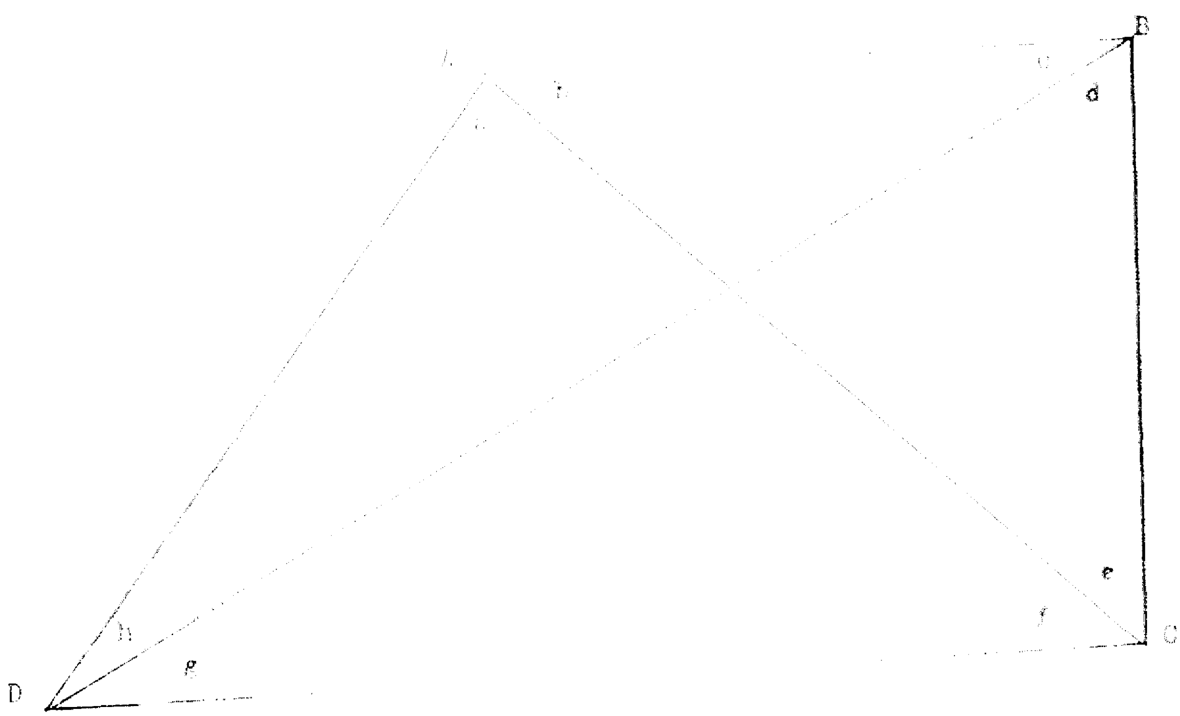
$$\epsilon = a_1 b_1 \sin C_1 \, m$$

where ϵ is the spherical excess; a_1, b_1 and C_1 are the two sides and the included angle, respectively, of the corresponding triangle. The letter letter m is used to designate that part of the expression which [illegible] depends only on the latitude and the dimensions of the spheroid and the values of log m are given with the latitude as an argument in the table on page [illegible] of Special Publication No. 8.

It is clear that no correction for spherical excess will be necessary unless the triangles are very large, and then only in the most precise work. One third of the correction is subtracted from each of the angles.

ADJUSTMENT OF A QUADRILATERAL

Before starting the adjustment of a net of triangulation the computer should make a good clear sketch showing all the lines over which observations were made. The angles around each station of a quadrilateral are adjusted to total 360° before the figure adjustment is made. In the figure adjustment, two conditions are considered: (1) the geometric condition that the sum of the interior angles of a rectilinear figure be equal to (n - 2)180°, in which n is the number of sides of the figure; and (2) the trigonometric condition that in any triangle the sines of the angles are proportional to the lengths of the sides opposite.



1. <u>Geometric Condition</u>. When all angles of a quadrilateral are measured there are four overlapping triangles. These are shown as triangles ABC, ACD, ABD, and BCD in the figure. In each of these triangles the sum of the three angles must be 180°. Hence from the figure,

$$b + c + d + e = 180° \quad (1)$$
$$a + f + g + h = 180° \quad (2)$$
$$a + b + c + h = 180° \quad (3)$$
$$d + e + f + g = 180° \quad (4)$$

Also the sum of the eight lettered angles in the figure must equal 360°, since they form the interior angles of a closed figure of four sides. This may be derived also by the addition of Eqs. (1) and (2) or (3) and (4).

$$a + b + c + d + e + f + g + h = 360° \quad (5)$$

Further, since the opposite angles at the intersection of the diagonals must be equal, it follows that

$$b + c = f + g \quad (6)$$

$$d + e = h + a \quad (7)$$

Equation (6) is the equivalent of Eq. (2) minus Eq. (3) and Eq. (7) is the equivalent of Eq. (2) minus Eq. (4).

If any three of these seven equations are satisfied, the other four must of necessity be satisfied also. Equations (5), (6), and (7) are the ones most convenient to use.

The following procedure is suggested for triangulation of ordinary precision:

A. Make the station adjustment as follows: Adjust the angles around each point to make their sum equal 360° by distributing the error equally (or approximately so) among the measured angles. (Not necessary with non-repeating instrument).

B. Using the values resulting from the station adjustment A, add the eight angles a, b, c, d, e, f, g, and h, and subtract their sum from 360°. Divide the difference by 8, and algebraically add the result to each of the eight angles, thus satidfying the condition of Eq. (5).

C. Using the adjusted values from B, find the difference between the sums (b + c) and (f + g) and divide that difference by four. Apply the result as a correction to each of the four angles, increasing each of the two whose sum is the smaller and decreasing each of the two whose sum is the larger, thus making these angles satisfy Eq. (6) without disturbing the adjustment for Eq. (5). Proceed in the same way with each of the four angles involved in Eq. (7).

2. <u>Trigonometric Condition</u>. If the length of one line, as BC, is known, and the length of the opposite side AD is to be computed, the computer may select one or another series of triangles for use in accomplishing this result. For example, a solution of triangle ABC gives the length of AC, then from triangle ACD the required length of AD is found; or in the triangle BCD the length BD is found, then in ABD the length AD is computed. There are four possible choices

of route through the figure. It now remains to be seen whether the angles, as so far adjusted, are so related as to make the value of the length of a computed side independent of the route used. Assume that the length of [illegible] is known and the length of AD is to be found.

$$BC = [illegible] \frac{\sin [illegible]}{\sin [illegible]}$$

$$AD = [illegible] \frac{\sin [illegible]}{\sin [illegible]} = [illegible] \frac{\sin [illegible]\ \sin [illegible]}{\sin [illegible]\ \sin [illegible]} \qquad (8)$$

Similarly,

$$AD = [illegible] \frac{\sin [illegible]}{\sin h} \cdot \frac{\sin [illegible]}{\sin h} \qquad (9)$$

Equating these two values of AD,

$$\frac{\sin [illegible]}{\sin [illegible]} \cdot \frac{\sin [illegible]}{\sin [illegible]} = \frac{\sin [illegible]}{\sin [illegible]} \cdot \frac{\sin [illegible]}{\sin h} \qquad (10)$$

or

$$\frac{\sin a}{\sin b} \cdot \frac{\sin c}{\sin d} \cdot \frac{\sin e}{\sin f} \cdot \frac{\sin g}{\sin h} = 1 \qquad (11)$$

Expressed in logarithmic form, (11) is

$$\log \sin a + \log \sin c + \log \sin e + \log \sin g - (\log \sin b + \log \sin d + \log \sin f + \log \sin h) = 0 \qquad (12)$$

The angles are tested for satisfaction of this equation by adding the logarithmic sines in the two groups as indicated and by finding the difference between the two sums.

Various adjustments by which this difference may be reduced to zero are possible. The least squares adjustment gives the most probable values to the adjusted angles, but it is somewhat more elaborate than is necessary for most surveys. A simple approximate method which gives an equal correction to each angle and does not disturb the geometric condition is as follows (see adjustment of the following example):

(a) Record the log sines as shown in the example.

(b) For each angle, record the tabular logarithmic sine difference for 1" opposite each logarithm.

(c) Find the average required change ($\bar{c}$) in log sin by dividing the difference between the sums by 8.

(d) Find the average difference ($\bar{d}$) for 1".

(e) The ratio $\bar{c}/\bar{d}$ gives the number of seconds of arc to be applied as a correction to each angle.

(f) Add this correction to each of the four angles the sum of whose log sines is the smaller, and subtract it from each of the angles the sum of whose log sines is the larger, and thus the corrected values are obtained.

If one or more of the angles is greater than 90°, adjustment D is made as just described, without changing the procedure in any way. However, since the sine of an obtuse angle decreases as the angle increases, the corresponding log sines will be changed in the direction opposite to that desired. Usually the error introduced by this condition will be negligible for this approximate adjustment; if not, adjustment D should be repeated.

<u>Example:</u> Given the angles as measured in the quadrilateral (see figure), for which the station adjustment (adjustment A) has been made (see second column of following table), find the adjusted angles for both the geometric and the trigonometric conditions.

Angle	Station adjustment	Figure adjustment		
		Geometric condition		Trigonometric condition
	Adjustment A	Adjustment B	Adjustment C	Adjustment D
a	94-05-58.5	58.8	[illegible]	58.8
b	48-03-03.4	0?.0	03.6	03.3
c	20-47-14.0	14.3	13.9	14.2
d	66-40-51.5	51.8	[illegible]	51.6
e	53-28-49.9	50.2	50.4	50.7
f	43-24-01.4	01.7	01.1	01.8
g	37-26-15.7	16.0	15.4	15.7
h	17-02-43.9	44.2	44.0	43.7
Sum	359-59-57.5	360-00-00.0	360-00-00.0	360-00-00.0

<u>Adjustment B.</u> The sum of the angles a, b, c, ... h, resulting from the station adjustment A, is found to differ from 360° by the amount of 2.5". This amount divided by the number of angles gives the amount of the correction (0.3? ") to be added to each angle as shown in the third column in the table.

<u>Adjustment 3</u> b + c = 68° 50' 16.8"
f + g = 68° 50' 14.?"

Dividing this difference by 4, the correction to each angle is found to be 0.4", to be subtracted from the angles b and c, and added to the angles f and g. In like manner, the correction to each of the angles d, e, h, and a is found to be 0.25", to be added to d and e, and subtracted from a and h. (Since these computations are carried out only to tenths of seconds, 0.3" is added to d, 0.2" added to e, 0.3" subtracted from a, and 0.2" subtracted from h.) The resultant angles are shown in the fourth column of the table.

<u>Adjustment 4</u>. Trigonometric Condition. The logarithmic sines of the angles as given by adjustment 3 and as indicated in equation (22) are recorded as shown in the following tabulation, and the tabular difference for 1" is recorded for each angle.

		Difference for 1"
Log sin a	9.979887?	3.0
Log sin c	9.559036	55.6
Log sin e	9.87????	17.6
Log sin g	9.634960	40.5
	9.099783	
Log sin b	9.870622	18.9
Log sin d	9.960?6?	11.9
Log sin f	9.?60???	28.9
Log sin h	9.???7??	68.9
	9.099783	
	9.099721	8)237.7
	8)62	29.7 = β
	7.8 = α	

The difference between the two sums is 62 units of the seventh place of logarithms used. This value, divided by 8, gives the average required change in log sine, 7.8 = α. The average tabular difference for 1" is 29.7 = β.

Hence $\frac{\alpha}{\beta} = \frac{7.8}{29.7} = 0.3"$ (nearly), which is the average correction to be applied to each angle. Obviously, it will be added to angles a, c, e, g and subtracted from angles b, d, f, and h.

Since this adjustment is applied with opposite sign to alternate angles, it does not disturb the previous condition. The final adjustment is given in the fifth column of the foregoing table.

If the triangulation system consists of a chain of quadrilaterals, each quadrilateral is adjusted in the manner just described. The computations for length of the various lines are then carried through the chain from the base line

COMPUTATION OF TRIANGLES

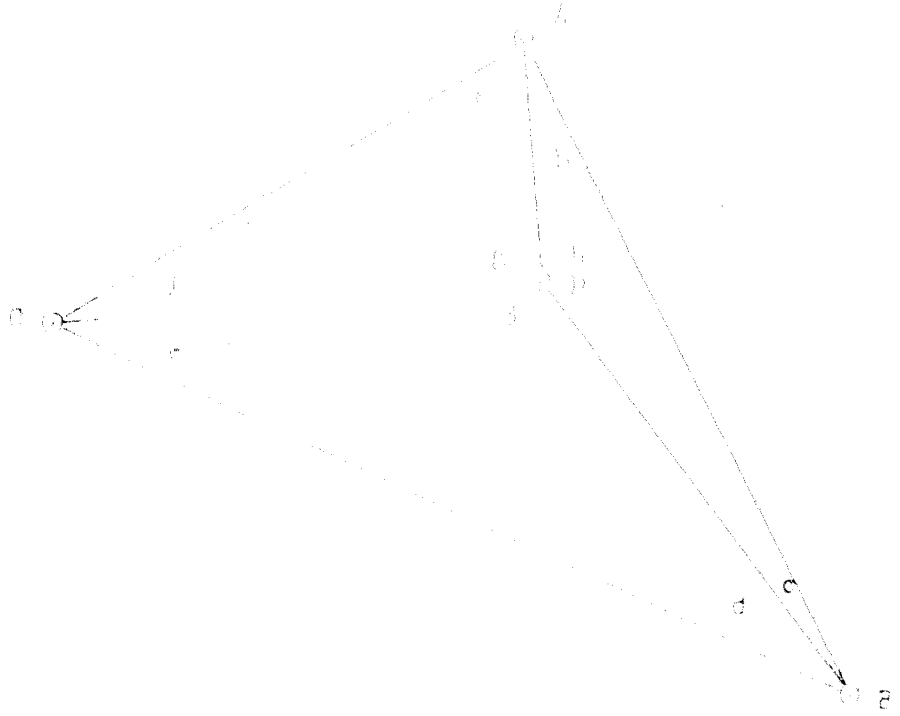
[illegible]				7773.53	3.8906178

As in the case of the quadrilateral, the angles around each station of a central point figure are adjusted to total 360° before the figure adjustment is made. In the figure adjustment of the quadrilateral, two conditions are considered: (1) the geometric condition, and (2) the trigonometric condition.



1. Geometric Condition. In each triangle of a central point figure the sum of the three angles must be 180°. Hence for the figure,

$$a + 1 + c = 180° \quad (1)$$
$$b + 2 + d = 180° \quad (2)$$
$$d + e + f = 180° \quad (3)$$

Also the sum of the fa (in this case six) angles forming the closed figure must total to (n-2) 180° where n is the number of sides of the figure (in this case four)

$$a + b + c + d + e + f = 360° \quad (4)$$

Also the sum of the angles around the central point must equal 360°.

$$1 + 2 + 3 = 360° \quad (5)$$

The following procedure is suggested for triangulation of ordinary precision:

A. Make the station adjustment as follows: Adjust the angles around each point to make their sum equal 360° by distributing the error equally (or approximately so) among the several angles.

B. Using the values resulting from the station adjustment A, add the three angles of each triangle and subtract the sum from 180°. Distribute the difference among the three angles to make their sum 180°, keeping in mind that the sum of the angles around the central point must remain 360°. This will necessitate correcting the angles at the central point by an unequal amount from those forming the closed figure. This satisfies Eqs. (1), (2), (3) and (5). Eq. (4) is satisfied automatically.

2. <u>Trigonometric condition</u>. There can be just one choice of route through the figure. It now remains to be seen whether the angles, as so far adjusted, are so related as to make the value of a length of a computed side independent of the route used. A derivation, similar to that in the quadrilateral adjustment, gives the following condition:

$$\frac{\sin a \sin c \sin e}{\sin b \sin d \sin f} = 1 \qquad (6)$$

The angles are tested for satisfaction of this equation by adding the logarithmic sines, as in the procedure for adjustment of a quadrilateral. The approximate method of correcting each angle equally which was suggested for the quadrilateral can be used for the central point figure.

<u>Example</u>: Given the angles as measured in the central point figure (see fig.) for which the station adjustment (adjustment A) has been made (see second column of following table). Find the adjusted angles for both the geometric and the trigonometric conditions.

123

Angle	Station Adjustment	Figure Adjustment	
		Geometric Condition	Trigonometric Condition
	Adjustment A	Adjustment B	Adjustment C
a	65 - 04 - [illegible]	65 - 04 - [illegible]	[illegible] 04 - 32.07
b	21 - 00 - [illegible]	21 - 00 - [illegible]	21 - 00 - 45.29
c	09 - 16 - [illegible]	09 - 16 - [illegible]	09 - 16 - 14.83
d	28 - [illegible] - [illegible]	28 - [illegible] - [illegible]	28 - [illegible] - 04.29
e	30 - 28 - [illegible]	30 - [illegible] - [illegible]	30 - 28 - 30.40
f	25 - 37 - [illegible]	25 - [illegible] - [illegible]	25 - 37 - 53.12
Sum	180 - 00 - [illegible]	180 - 00 - [illegible]	180 - 00 - 00.00
g	89 - 37 - [illegible]	89 - 37 - [illegible]	
h	149 - 45 - [illegible]	149 - [illegible] - [illegible]	
i	120 - [illegible] - [illegible]	120 - [illegible] - [illegible]	
Sum	360 - 00 - [illegible]	360 - 00 - [illegible]	

Adjustment B. [illegible] Condition. The sum of the angles in each of the three triangles are:

[illegible] a + d + g = 179 - 59 - [illegible]
[illegible] b + e + h = 180 - 00 - [illegible]
[illegible] c + f + i = 180 - 00 - [illegible]

In triangle [illegible] the sum of a, d and g differs from 180° by [illegible]. If an equal correction were applied to each angle, the correction would be + 0.2[illegible]". Similarly, in triangles [illegible] and [illegible], the [illegible] correction would be [illegible] and -0.19". Applying this [illegible] correction to angles g, h and i, their sum is found to differ from 360° by [illegible]. By [illegible] the correction to angles h and i by 0.10" and [illegible] the correction to angle g by [illegible] Eq. [illegible] is satisfied. The remaining [illegible] in each triangle is then distributed equally between the other two angles of each triangle, thus satisfying eqs. (1), (2) and (3).

Adjustment [illegible] of the angles as given [illegible] recorded as shown in the following tabulat[illegible] for each angle.

		Difference [illegible]
Log sin a	[illegible].8575435	[illegible]
Log sin c	[illegible].2070994	[illegible]
Log sin e	[illegible].7051490	[illegible]
	[illegible].[illegible]697919	
Log sin b	[illegible]648766	[illegible]
Log sin d	[illegible]791439	[illegible]
Log sin f	[illegible]360660	[illegible]
	[illegible]697865	[illegible]
	[illegible]697919	
	54	

The difference [illegible] the two sums [illegible] of the seven places of logarithms used [illegible] divided by [illegible] the averabe required change in log sine, [illegible] for 1" [illegible] 52.0 = β. Hence

$$\frac{\alpha}{\beta} = \frac{9.0}{52.0} =$$ [illegible] be applied to each angle. [illegible] subtracted from angles a, [illegible], e.

Since this adjustment is applied [illegible] to alternate angles, it does not disturb the geometric [illegible] adjustment is given in the fourth column [illegible].

[illegible]

[illegible] Between [illegible] and Back Azimuths

The differences between forward azimuths and back azimuths are caused by convergence of the meridians toward the poles. This relation is shown in the following sketch.

[illegible] represents the meridian through station A, [illegible] the meridian through station B. [illegible]

It is evident that [illegible] α_1 (or azimuth from A to B) is not exactly 180° different from the azimuth α_2 (or azimuth from B to A, which is called the back azimuth [illegible]). [illegible] shows that the azimuth [illegible]

$\Delta\alpha$ must be applied [illegible] greater [illegible] easterly [illegible]

[illegible]

[illegible]

To apply the correction for difference in azimuth.

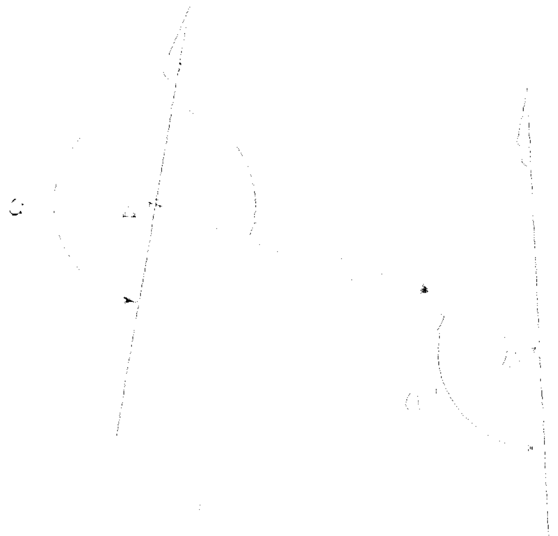


Fig. 1

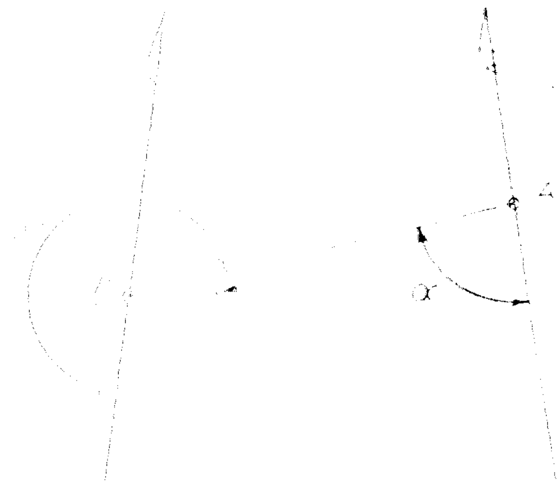

Fig. 2

North Latitude — West Longitude

Note: All west longitudes are positive in sign.

In Fig. 1 the direction of progress is from A to B, the longitude is decreasing, therefore Δλ is minus in sign.

By inspection (θ + 180°) is smaller than (θ') therefore a plus correction is applied to the forward azimuth (θ) to obtain the back azimuth (θ'). (Δλ) and (Δθ) are opposite in sign.

In Fig. 2 the direction of progress is from B to A, the longitude is increasing, therefore (Δλ) is plus in sign.

By inspection (θ') is larger than (θ + 180°) therefore a minus correction is applied to the forward azimuth (θ) to obtain the back azimuth (θ'). (Δλ) and (Δθ) are opposite in sign.

Note: In west longitudes the difference in longitude (Δλ) and difference in azimuth (Δθ) are opposite in sign.

North Latitude — East Longitude

Note: All east longitudes are minus in sign.

In Fig. 1 the direction of progress is from A to B, the longitude is increasing, therefore the Δλ is plus in sign.

By inspection (θ + 180°) is smaller than (θ') therefore a plus correction is applied to the forward azimuth (θ) to obtain the back azimuth (θ'). (Δλ) and (Δθ) are both plus in sign.

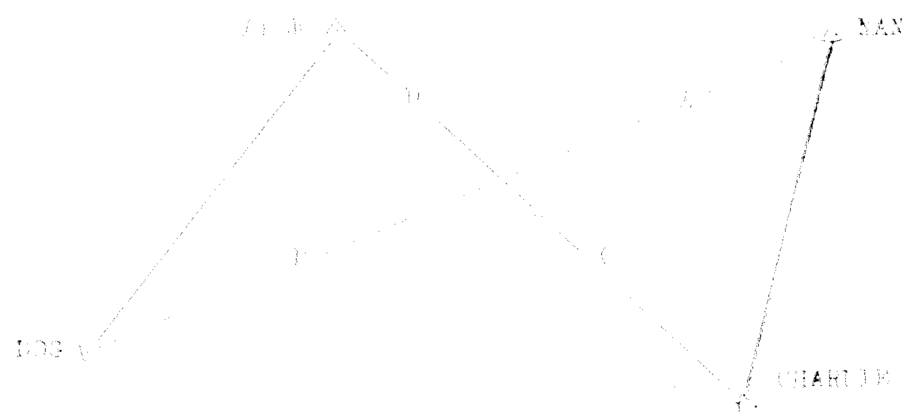
PROBLEM IN EAST LONGITUDE

23 MARCH 1956

COMPUTATION OF TRIANGLES

Computation of the four triangles of an observed quadrangle is a required part of the field work in order that it may be ascertained that the observed angles are within tolerances set up by the specifications. This is the first check on the accuracy of the observations as the angles observed can be within prescribed limits and not meet the requirements of the side check.



In the quadrangle shown in the sketch the line MAN-CHARLIE is the base or known line. The expansion of the net is from the line ABLE-DOG as determined from this quadrangle. The field computations for the quadrangle are shown on the form which sets up the computation in proper sequence.

The R_1 or strongest pair of triangles from which the line ABLE-DOG can be determined are entered first on the form in sections A and B, followed by the second best pair in sections C and D.

The individual triangles are always numbered in a clockwise direction with (1) at the new station and (2) and (3) at the stations on the known line. The line 2-3 is always the known line.

Computations are completed in the following order with figures rounded off to the closest hundredth for first order and to the closest tenth for second order triangulation.

(a) Enter the names of the stations and the observed angles in columns 1 and 2 corresponding with the numbers in reference to the individual triangles.

(b) The closing error of each triangle is distributed equally, or nearly so, between the three angles and entered in column 3. The plane angles which are determined by this correction are entered in column 3 and should total 180°. It should be noted that this distribution of the closing error of the individual triangles does not nullify the necessity of a quadrilateral adjustment. The sum of the individual angles at a station may differ slightly from the overall angle, yet this method is satisfactory for the first check and final balancing of the angles are accomplished by the side equation adjustment or in more precise adjustment by the method of least squares.

23 MARCH 1956

(c) To complete the first triangle (A), being [illegible] in column 7, enter the logarithm of the [illegible] side [illegible], the [illegible] of the log sin of 1 and the log sines of 2 and [illegible]. Line [illegible] is the sum of the logarithms [illegible]. Line [illegible] is the sum of the logarithms [illegible]. From the logarithms of 1-2 and 1-2 determine the [illegible] column 6. Complete the computation of triangles (B), (C) and (D) in [illegible].

(d) The spherical excess [illegible] computed from the formula $e = a, b, C, x\ m$ where a, b, and C, are the [illegible] sides and [illegible] of the corresponding triangle. Three decimal places are [illegible] in computing this quantity.

Obtain log m corresponding to the [illegible] of the quadrangle from S.P. no. 8 page 16. To log m add the log [illegible] lines 2-3, 3 and 1-3 taken from column 7. The [illegible] is the logarithm of [illegible] spherical excess which is to be entered in column [illegible] distributing [illegible] equally, or nearly so, between the three angle. The [illegible] to the plane angles and entered in column [illegible].

Example	Triangle B	log m	1.40?
		[illegible]	?.396
		[illegible]	9.820
		[illegible]	4.152
		log e	9.377 = 0.?"

The excess of 0.?" is distributed 0.1" each to one of the angles.

(e) The total correction to the observed angle is the difference between it and the spherical angle (column 6). The correction is plus or minus depending on whether the spherical angle [illegible] is larger or smaller than the observed angle.

SIDE CHECKS. In the computation of a [illegible] quadrangle there are always three lines which have two determinations of their length. One of the requirements of first order triangulation is [illegible] the difference between the two values for the logarithm of the length of a line be [illegible] greater than two times the log sine difference for one second [illegible] smallest distance angle involved in the computation of either value. [illegible] this value is the allowance for second order triangulation.

Referring to the following [illegible] computation [illegible]

Line A, 1-2	[illegible]	[illegible]	69
" B, 1-2	[illegible]		× 4
Actual diff.	[illegible]	Allowable diff.	276
Line B, 1-3	[illegible]	[illegible]	41
" C, 1-3	4.3117?78		× 4
Actual diff.	[illegible]	Allowable diff.	164
Line A, 1-?	[illegible]	[illegible]	55
" D, 1-?	[illegible]		× 4
Actual diff.		Allowable diff.	220

If this computation does not satisfy the conditions of the side check reobserving at one or more stations will be necessary. The most probable angles to reobserve [illegible] computation or by applying [illegible]. When these conditions have been satisfied the quadrangle can be considered [illegible] the requirements and no further field work [illegible].

TRIANGULATION STATIONS

ESTABLISHMENT OF A NEW STATION

Upon establishment of a new station, at least two and preferably three reference marks should also be established. The station mark should be a 3-5/8" dia. brass, or other non-ferrous metal marker, much the same as a Bench Mark. The station mark should be stamped with the name of the station, U S N and the year it is established. The station point should be a punch mark as near the center of the marker as possible. This marker should be set in concrete in such a way that it cannot be easily disturbed. Local conditions should govern this; however, the ideal monument would be a 12" x 36" concrete piling anchored to the coral reef underlying the island soil. The reference mark should be of non-ferrous metal with a surface large enough to stamp the following on it: R.M. No. (1 or 2 etc.) - the station name, U S N and the date established. A 3" diameter or larger brass marker is most desirable, but a large iron drift or brass bolt bent at pipe would be also acceptable. This marker should be set in a concrete monument similar to that for the station mark, or grouted into reef rock. If a head and tack in either a concrete slab or the reef is used, a small brass tack (such as a brass escutcheon pin) should be used and the head [illegible] should be large enough to stamp the required data on it.

When the station and the reference marks have been established, a complete description should be prepared containing the following information:

(1) A physical description of the station mark and the RM's including what type of marker was used, how it is mounted, and how it is set (concrete, grouted into a bldg. slab, etc.).

(2) A sketch of the station's location on the island in relation to high tide line, break line, trees, and outstanding buildings or structures.

(3) A measurement of the angles at the station mark to each of the reference marks from an initial azimuth, or another station (preferably the control point station (Coral at Eniwetok Atoll, [illegible]) or a prominent landmark whose coordinate location is known.

(4) The measured distance from the station mark to each of the Reference Marks and the distances between the reference marks.

(5) The elevations of the station and the all references. If no data is available to obtain the elevations, an elevation should be obtained from vertical observations and data for that purpose. At no time should an assumed elevation be used.

(6) A brief description of the instruments, equipment and methods used in making the measurements in paragraphs 3, 4 and 5.

Where at all practical the station mark should be enclosed with a triangular wooden barricade and the reference marks by a painted 4 x 4 post on the side away from the station mark.

RECOVERY OF AN EXISTING STATION

The purpose of station recovery is to ascertain accurately the serviceability of an existing triangulation station using the horizontal and vertical locations already available without additional field work, and to provide a check on any possible future loss or damage to the station which would render it useless without further field work.

All previous recovery notes and station descriptions should be made available to the person making the recovery to insure a full and accurate recovery of the station.

When the station has been found with its Reference Marks, data corresponding to the data required in the preceding section on station description should be obtained. This data should be obtained in or near the same manner and using as near the same methods and equipment as were used in the latest station description or recovery. These values should be recorded on a "Recovery Note, Triangulation Station" form which is very similar to the "Description of Triangulation Station" form. Any differences in measured values from previous values should be checked and, if found to be actual changes, should be noted. Also any changes in the features of the location which might serve as an aid in relocating the station should be noted.

the recovery note and a sketch of the location similar in content to the sketch required for the Mobile Description should also be included in the recovery.

In the event a station or reference mark has been disturbed or damaged in any way, no attempt to correct this should be made on the initial recovery mission. Instructions for corrections, changes, replacements, etc. will be issued by the Survey Office after evaluation of the initial recovery note from the field. When instructions on changes, replacements, etc. are issued, they will be issued in conformity with U. S. C. & G. S. procedures as outlined in S. P. #247, modified to fit onsite conditions.

FIELD NOTES

Survey Department

1. A record must be made of all field survey work in a duplicating Field Book. There are no exceptions. On projects, such as, plane table work, in which the actual work performed is not entered in the Field Book, a Field Book entry must be prepared as outlined in Paragraphs 9 and 11. The data not recorded in a Field Book will show the same information as the Field Book entry.

2. Two Field Books will be carried by each Party Chief. One book will be used for all Domestic (non-scientific) work, the other for Scientific work.

3. In Scientific work, Stations are referred to by number (i.e. not as shot tower, detector, etc.).

4. In Domestic work, all Buildings are referred to by number (i.e. not as mess-hall, water tower, etc.).

5. In both Domestic and Scientific work it is extremely important to show elevations of structures. Unless specifically directed otherwise, this should be in relation to the site datum. The notes must include all the details of the work.

6. Angles turned must show actual details, such as, initial, double or six, and mean. Generally, no pre-planned angles will be shown. Should it be desirable to show pre-planned angles, it should be clearly labeled as such.

7. Distances measured must show actual details, such as, forward and back measurements, equipment, such as, steel tape, spring balance, etc.

8. Sketches are used to clarify the work performed. When deciding whether one is necessary, remember that the notes will be processed and used by others not as familiar with the circumstances as you may be. Label all points shown and use a north arrow.

9. The first line of the left hand page shows the specific location and type of work. Examples: Building 207, [illegible] Layout; Station 120, W.P. Location; Warehouse Area, Topography, [illegible] 102, Levels. On the second line show the site by its current code name, such as, Site Elmer. For work located near [illegible], [illegible] the Elmer Reef; Sites Elmer-Fred Lagoon.

10. When continuous pages in the same Field Book are used, it is not necessary to repeat the title; however, the bottom of the first right hand page used must show "continued on page ______". The following pages, each one must show "continued from page ______" at the top and "continued on page ______" at the bottom of the right hand page, and the bottom of the last page used shall show "end of survey". In cases where pages used are not in sequence in the same book, or are in different books, the title shall appear on each page.

11. The first line on the right half of the right hand page is used for the date and beneath it on succeeding lines are the names of the party, state of the weather and the time of starting and stopping work.

12. An index shall be kept on the first page of each Field Book, in the following manner:

PAGE	DESCRIPTION	SITE
[illegible]	Station [illegible], [illegible]	Ruby
[illegible]	Station 102, [illegible]	Ruby

13. Field Book original pages must be turned in daily to the Survey Office.

14. ALL FIELD NOTES ARE TO BE MADE [illegible] THERE ARE NO EXCEPTIONS.

M. F. Curran:jr
16 August 1956

FIELD NOTE [illegible]

Field Note original pages (white sheets) are indexed immediately after arriving at the office. They are then thoroughly checked for accuracy and completeness. If the checker finds them unsatisfactory, he returns them to the Chief of Party with a note attached stating the details in question.

When the Field Note originals have been checked and found satisfactory, the checker turns them over to the Department Head. The latter assigns them to a computer or draftsman for necessary action, such as, preparing tabulations, drawings, etc. After all necessary action has been taken, the Field Note originals are filed in the binder labeled with the Field Book number corresponding to that of the Field Notes. At this time a note is made on the Field Note pages in red pencil stating what action was taken.

If no one is available to take the necessary action, the Department Head makes an entry in a pending file. This file is reviewed daily.

When the Chief of Party has used all of the pages in a Field Book from 2 to 30 inclusive, he turns in the Field Book index kept on Page 1. The Field Book originals are checked and the Chief of Party called to account for any missing pages.

The Index of Field Books consists of 3 x 5 inch cards kept in a standard metal file box. A Domestic and a Scientific file is kept for each Atoll. These are subdivided as follows:

DOMESTI[illegible]

SITE

Buildings	Numerical order
Roads	Alphabetical order
Sewers	Alphabetical order

[illegible]

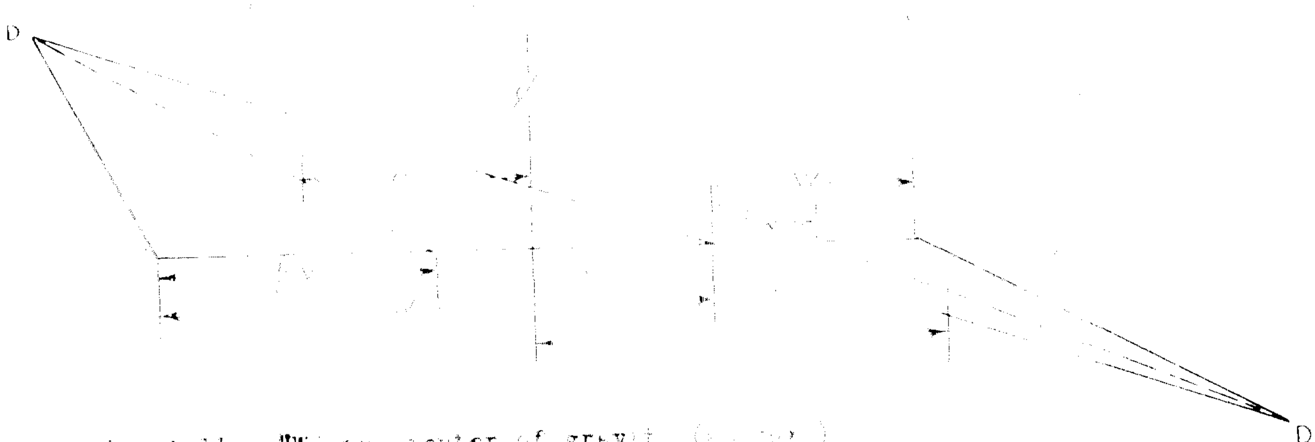
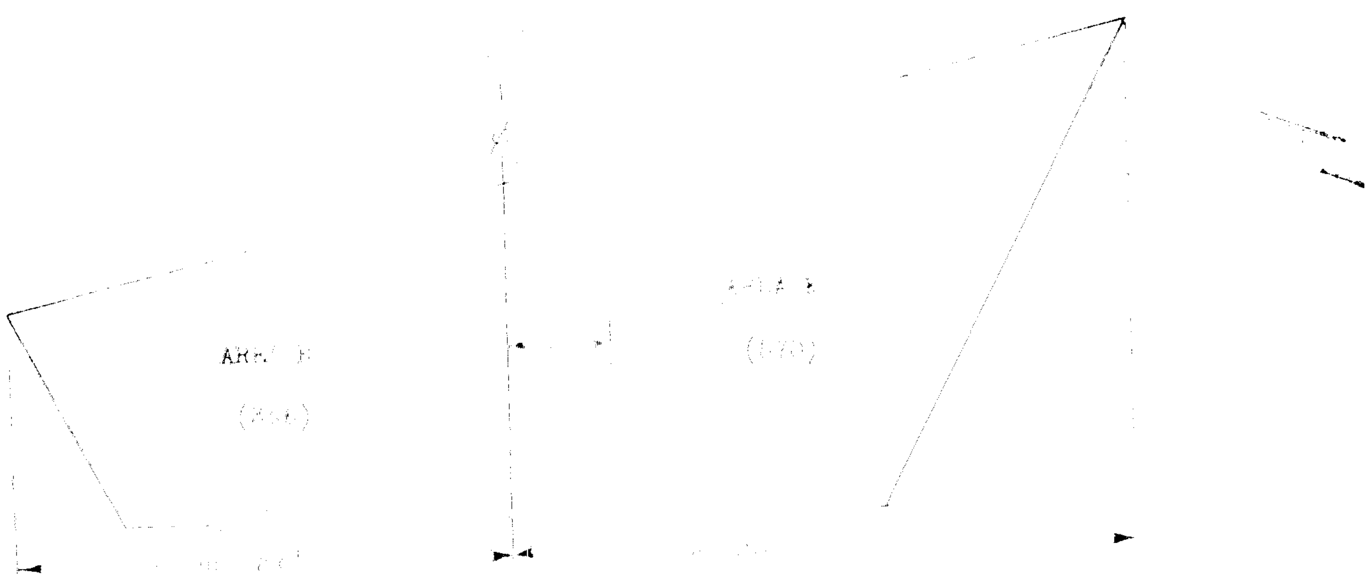
[illegible] OF CENTER OF GRAVITY OF SECTION



Bisect line "W" and center of gravity ([illegible]) is 1/3 the distance from this point [illegible]

Eccentricity of the section is the [illegible] for the center of gravity to centerline.



$e = \frac{B + Y}{3?} ([illegible])$

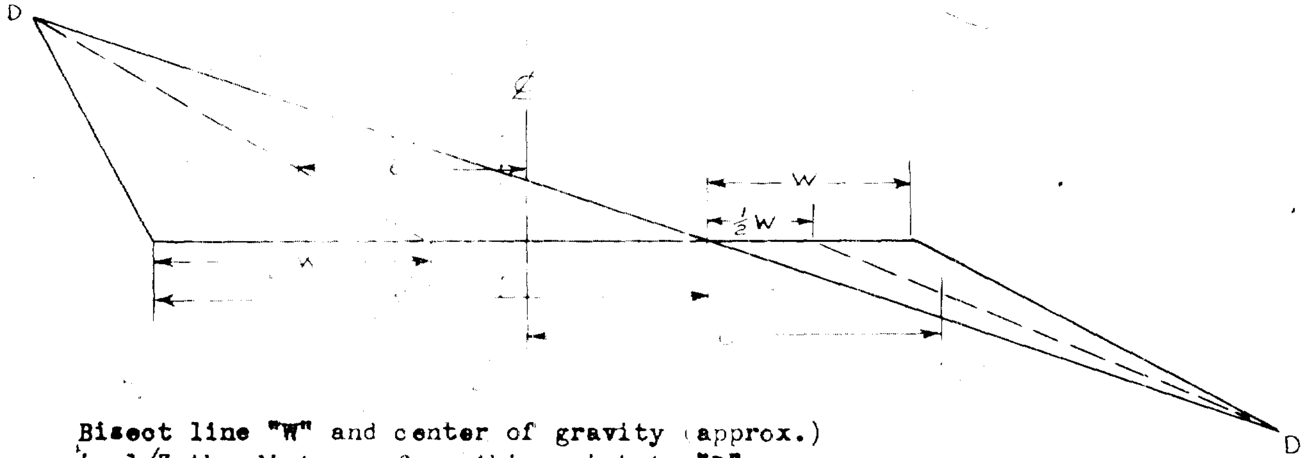
B = 866
Y = 870
[illegible] = 224

$e = \frac{58}{2448} \times 224$ [illegible]

Determine area of sections each side of the centerline. Scale the distance from centerline to [illegible] on each side and apply the formula.

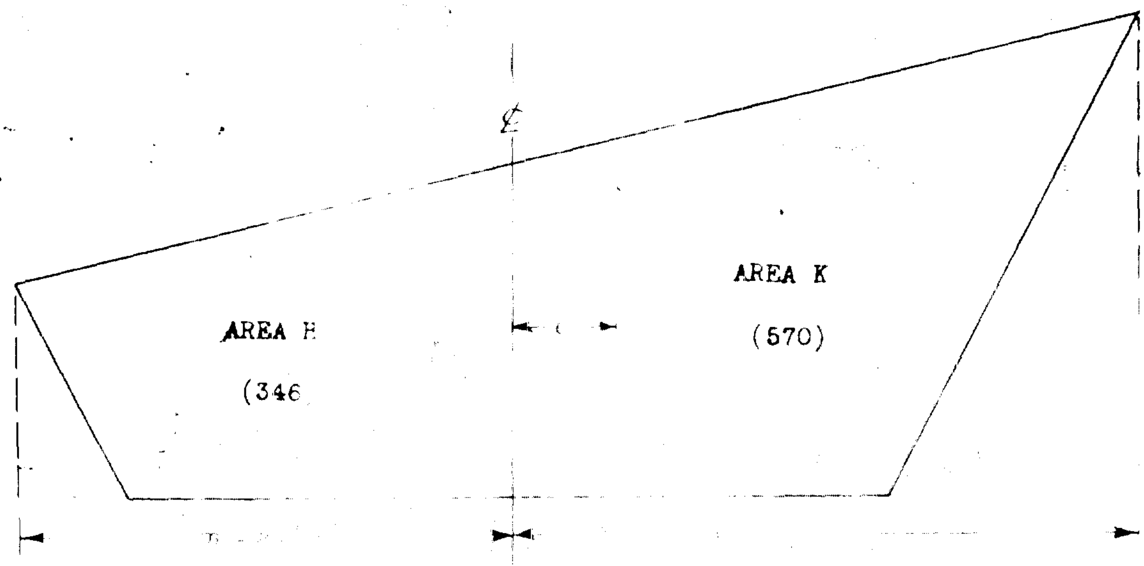
240
Sur 26

ECCENTRICITY OF CENTER OF GRAVITY OF SECTION



Bisect line "W" and center of gravity (approx.) is 1/3 the distance from this point to "D".

Eccentricity of the section is the distance from the center of gravity to centerline.



$e = \frac{n + m}{3A} (K - H)$

H = 346
K = 570
Sum [illegible] Diff. = 224

$e = \frac{69}{2448} \times 2.4$ [illegible]

Determine area of sections each side of the centerline. Scale the distance from center line to top of cut on each side and apply the formula.

1613.333 cu-yds. per 1.0 ft. = 161.333 per 0.1 ft.

Pg 248

TEMPERATURE CORRECTION TABLE

Coefficient of Expansion - 0.0000004
Standard Temperature - 20° C.
Indicated corrections are decimal parts of a meter in the 5th place and are plus for temperature above 20°
